The publication will be updated with the most recent data on a quarterly basis and will be posted on the portal of ELSTAT on the first Wednesday of January, April, July and October.

- (1) Dependency ratio: the ratio of the persons aged 0 - 14 and 65 years and over to the persons aged 15 - 64 years.
Ageing ratio: the ratio of the persons aged 65 years and over to the persons aged 0 - 14 years.
Mean age of the mother at birth: it refers to all live births that were recorded during the reference year, regardless of the birth order.
Total fertility rate: the average number of living children that a woman will give birth to over the course of her lifetime (provided that during her reproductive age, the fertility conditions prevail by age of the reference year). The total fertility rate is used in order to determine the level of replacement of the generations, which, in developed countries, is considered to be 2.1.
Crude death rate: the number of deaths during the reference year per 1,000 average population of usual residents.
Infant mortality rate: the number of children dying at less than 1 year of age divided by the number of live births that year. The ratio is expressed by 1,000 live births.
- (2) The demographic indicators for the years 2011-2023, except for the infant mortality rate, have been revised, as they were calculated based on the revised population time series.

(1) Any kind of extraction of energy products from natural sources to a usable form is called primary production. Primary production takes place when the natural sources are exploited, for example, in coal mines, crude oil fields, hydro power plants or fabrication of biofuels. Transformation of energy from one form to another, like electricity or heat generation in thermal power plants or coke production in coke ovens, is not primary production.

(1) School expectancy corresponds to the expected years of education over a lifetime and has been calculated adding the single-year enrolment rates for all ages from the age of 5 years and over. To illustrate the meaning of school expectancy, let us take an example: school expectancy for the age of 10 would be one year, if all 10-year-old students (in the year of the data collection) were enrolled. If only 50 % of 10-year-old students were enrolled, school expectancy for the age of 10 would be half a year.
