

HELLENIC REPUBLIC

HELLENIC STATISTICAL AUTHORITY

Piraeus, 8 May 2023

RISK OF POVERTY

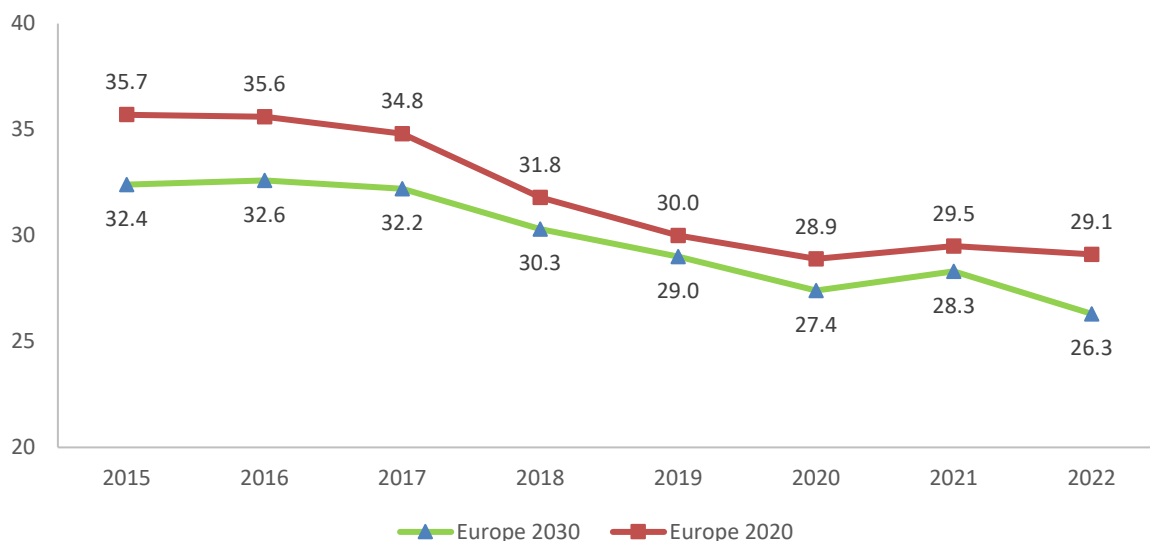

2022 Survey on Income and Living Conditions (Income reference period: 2021)

The Hellenic Statistical Authority (ELSTAT) announces data on the risk of poverty, based on the 2022 Survey on Income and Living Conditions of Households (EU-SILC), *with income reference period the year 2021*. This survey is the main source for comparable statistics on income distribution and social exclusion at European level.

A. Risk of poverty or social exclusion

Based on the data of the 2022 Household Income and Living Conditions Survey, the population at risk of poverty or social exclusion, according to the revised definition¹, amounts to 26.3% of the country's population (2,722,000 people), showing a decrease by 2.0 percentage points compared to 2021 (Graph 1). The target set in social protection by the European Pillar of Social Rights Action Plan “EU 2030 targets” is: ‘The number of people at risk of poverty or social exclusion should be reduced by at least 15 million, out of them, at least 5 million should be children’ by 2030.

Graph 1. Percentage of population at-risk-of-poverty or social exclusion: 2015 – 2022

¹ **Revised definition - Population at risk of poverty or social exclusion:** population at risk of poverty or with material and social deprivation (i.e., Proportion of the population experiencing an enforced lack of at least 7 out of 13 deprivation items) or living in households with very low work intensity – more information in explanatory notes.

Based on the initial definition² of the above indicator, the population at risk of poverty or social exclusion amounts to 29.1% (3,006,300 people) of the Country's population, recording a decrease by 0.4 percentage points compared to 2021 (29.5%). Graph 1 presents the evolution of the index since 2015. It is noted that, the "Europe 2020" program had set the target of reducing poverty by 'lifting at least 20 million people out of the risk of poverty and social exclusion', by 2020.

Graph 2. Percentage of population at-risk-of-poverty, material social deprivation and low work intensity (Europe 2030): 2015 – 2022

The decrease in the percentage of the at-risk-of-poverty or social exclusion (a composite indicator compiled on the basis of at-risk-of-poverty, material and social deprivation and low work intensity) is due to the decrease in the percentage of the population in low work intensity, to 9.5% in 2022 from 12.1% in 2021, and of the population at-risk-of-poverty, to 18.8% in the year 2022 from 19.6% in 2021 (Graph 2).

The risk of poverty or social exclusion is higher in the case of children aged 17 and under (28.1%), decreased by 3.9 percentage points compared to 2021 (32.0%) (Table 1).

The percentage of the population aged 18-64 living in households with low work intensity is estimated at 10.9% of the total population of this age group, showing a decrease of 2.7 percentage points compared to the year 2021. The percentage for men amounts to 9.9% and for women to 12.0% (Table 2).

Table 16 presents the at-risk-of-poverty or social exclusion rate for the years 2015-2022, for those European countries for which the 2022 EU-SILC survey results are available so far.

B. At risk-of-poverty rate³ and poverty threshold after social transfers

The poverty threshold amounted to 5,712 Euros per single person household annually and to 11,995 Euros for households with two adults and two dependent children under 14 years old (Table 4). By definition, it is set at 60% of the median of the total equivalised disposable household income, which was estimated at 9,520 Euros, whereas the mean annual disposable income of the households of the Country was estimated at 18,563 Euros.

² **Initial definition - Population at risk of poverty or social exclusion:** population at risk of poverty or material deprivation (i.e., Proportion of the population experiencing an enforced lack of at least 4 out of 9 deprivation items) or living in households with low work intensity - more information in the explanatory notes.

³ The "at-risk-of poverty rate (after social transfers)" is defined as the percentage of persons (over the total population) with an equivalised disposable income below the 'at-risk-of-poverty threshold' (i.e., below the 60% of the median equivalised disposable income).

In 2022, 18.8% of the total population was at risk of poverty⁴, recording a decrease of 0.8 percentage points as compared to 2021. This indicator amounted to 19.6% in 2005 (with income reference period 2004) and recorded an upward trend up to 2012 (23.1%), starting to decrease from 2014 onwards (except for 2021), as depicted in Graph 3 that follows.

Graph 3. Population at risk of poverty: 2005, 2008 – 2022*

**It is noted that the income reference period is the year prior to the year the survey is conducted, that is, the data on income refer to the period 2004, 2007 - 2021.*

The number of households at risk-of-poverty is estimated at 742,235 out of a total of 4,049,102 households, and the members of these households amount to 1,945,199 out of a total of 10,399,329 persons which is the Country's estimated total population living in private households.

The at-risk-of-poverty rate after social transfers, for children aged 0-17 years (child poverty) amounted to 22.4%, recording a decrease by 1.3 percentage points as compared to 2021 (23.7%), whereas for the population of the age groups 18-64 and 65 years old and over amounted to 18.9% (20.6% in 2021) and 15.8% (13.5% in 2021), respectively (Table 5).

The at-risk-of-poverty rate, using thresholds other than the 60% of the median of the total equivalised disposable household income, amounts to:

- 6.7%, when the risk of poverty threshold is defined at 40% of the median of the total equivalised disposable household income,
- 11.9%, when the risk of poverty threshold is defined at 50% of the median of the total equivalised disposable household income and,
- 26.2%, when the risk of poverty threshold is defined at 70% of the median of the total equivalised disposable household income, respectively.

In five (5) Regions (Kriti, Attiki, Notio Aigaio, Ipeiros, Thessalia) the at-risk-of-poverty rate is lower than that of the Country total, while in the remaining eight (8) Regions (Ionia Nisia, Voreio Aigaio, Dytiki Ellada, Peloponnisos, Dytiki Makedonia, Sterea Ellada, Kentriki Makedonia and Anatoliki Makedonia and Thraki) the corresponding percentages are higher (Graph 6).

⁴ It should be noted that the population groups which are by inference poor, such as homeless, part of illegal economic immigrants, Roma who are on the move and change residence, etc. are underrepresented in the survey.

Graph 4. Population at risk of poverty by Region: 2022

Graph 5 depicts the importance of the level of education in reducing the risk of poverty. The higher the level of education is, the lower the risk of poverty. For the year 2022, the risk of poverty is estimated at 25.9% for those having completed pre-school, primary and first stage of secondary education, at 18.0% for those having completed second stage of secondary education and post-secondary education, and at 7.2%, for those having completed first and second stage of tertiary education.

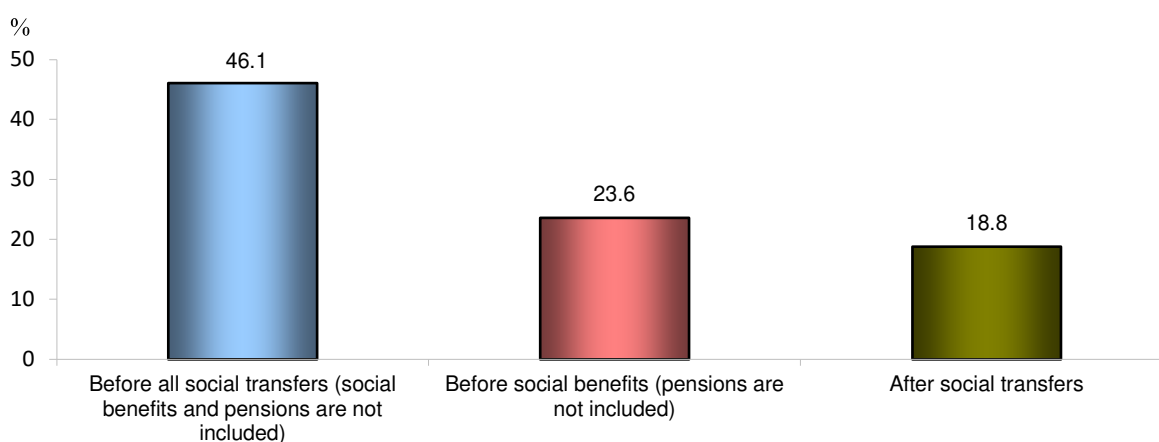

Graph 5. Population aged 18 years and over at risk of poverty by education level completed: 2008-2022

C. Social transfers and the at-risk-of-poverty rate

The at-risk-of-poverty rate before all social transfers (excluding social benefits⁵ and pensions⁶ in the total disposable household income) is 46.1%, while when only pensions are included, (social benefits are excluded), the risk of poverty rate drops to 23.6% (Graph 6, Tables 6 and 7). As regards social benefits, it should be noted that they include certain social assistance allowances (such as the allowance of social dividend, allowances to long-standing unemployed, etc.) family benefits (such as children's allowances), as well as unemployment, sickness, disability/invalidity benefits or education allowances. The at-risk-of-poverty rate for the total population after social transfers is 18.8%, from which it can be concluded that the inclusion of social benefits contributes to a decrease of 4.8 percentage points in the at-risk-of-poverty rate, while the inclusion of pensions contributes to a decrease of 22.5 percentage points. Social transfers in total, reduce the at-risk-of-poverty rate by 27.3 percentage points (Graph 6, Tables 5, 6 and 7).

Graph 6. At-risk-of-poverty rate

D. Characteristics of at risk-of-poverty population

In 2022, the at-risk-of-poverty rate is higher for females (19.4%) compared to that of males (18.2%) (Table 7).

The at-risk-of-poverty rate for males and females decreased by 0.4 and 1.2 percentages points, respectively.

The at-risk-of-poverty rate for persons aged 65 years and over amounted to 17.6% for women and to 13.6% for men (Table 8).

The at-risk-of-poverty rate for persons aged 75 years and over amounted to 16.8%, whereas for persons under 75 years old to 19.1% (Table 8).

The at-risk-of-poverty rate for women aged 75 years and over amounted to 19.5%, while for men of the same age group amounted to 13.0% (Table 8).

⁵ **Social transfers** are considered to be social benefits, i.e., social assistance (Minimum Guaranteed Income, heating allowance, housing allowance, a lump sum amount for assistance to poor households in mountainous and disadvantageous areas as well as low-income families, children with compulsory education, children with compulsory education, Social Solidarity Allowance for Uninsured Elderly, assistance for the basic needs of people affected by earthquakes, floods, etc.), family benefits, unemployment benefits / allowances, sickness benefits / allowances, disability benefits / allowances and disability benefits, and pensions.

⁶ **Pensions** are considered old-age pensions from work and pensions / allowances from the spouse.

The at-risk-of-poverty rate for households with a single parent and at least one dependent child amounts to 37.7%, while for households with three or more adults with dependent children amounts to 21.7% and for households with two adults and 2 dependent children to 18.9% (Table 9).

Employed persons over 18 years face a lower risk-of-poverty compared to unemployed or economically inactive persons (housewives, etc). The at-risk-of-poverty rate for employed persons over 18 years amounts to 10.6%, decreasing by 0.7 percentage points compared to 2021. A decrease was recorded for employed women over 18 years, by 1.1 percentage points, while for employed men an increase was recorded by 0.3 percentage points, with the respective percentages at 7.7% and 12.7% (Table 10).

For unemployed persons, as already mentioned, the at-risk-of-poverty rate is significantly higher and amounts to 43.6%, showing a significant difference between males and females (51.8% and 37.0% respectively). The at-risk-of-poverty rate for economically inactive persons (excluding pensioners) increased by 1.8 percentage points in comparison with 2021 and it was estimated at 29.1% (Table 10).

The at-risk-of-poverty rate for people in work aged 18-64 is 10.6%, recording a decrease of 0.5 percentage points compared to the year 2021. The at-risk-of-poverty rate for working women 18 -64 years old decreased by 0.8 percentage points and by 0.2 percentage points for working men of the same age group, with the respective percentages at 7.8% and 12.6% (Table 11).

The at-risk-of-poverty rate for persons working full-time amounts to 9.9%, while for part-time employed persons amounts to 18.4% (Table 12).

The at-risk-of poverty rate for households residing in owned dwellings is 18.8%, while for those residing in rented dwellings amounts to 19.0%. The at-risk-of-poverty rate for children aged 0-17 years living in own dwelling is 23.6%, while for those at the same age group who live in rented dwellings the at-risk-of-poverty rate is 19.9%. The at-risk-of-poverty rate for owner-occupiers aged between 18 and 64 years is 19.0%, whereas for those at the same age group who live in rented dwellings is estimated at 18.8% (Table 13).

E. Relative median at-risk-of-poverty gap

The relative median at-risk-of-poverty gap refers to the intensity of the poverty risk of people with an equivalised disposable income below the at-risk-of-poverty threshold. It is calculated as the difference between the at-risk-of-poverty threshold of the total population and the median equivalised disposable income of persons below the at-risk-of-poverty threshold, expressed as a percentage of the at-risk-of-poverty threshold.

Graph 7. Relative median at-risk-of-poverty gap: 2005, 2008-2022

In 2022, this indicator was 23.8% of the at-risk-of-poverty threshold, decreased as compared to the previous year (Graph 7, Table 14). Based on this percentage, it is estimated that 50% of the poor population has an income lower than 76.2% of the at-risk-of-poverty threshold (5,712 euros), i.e., lower than 4,353 euros per person, per year.

As shown in Graph 7, the relative at-risk-of-poverty gap was 23.9% in 2005, while following an upward trend it was estimated at 32.7% for 2013 (highest recorded value). From then on, it fluctuated and amounted to 23.8% in 2021, recording a decrease of 2.6 percentage points compared to 2021.

F. Risk of poverty after social transfers calculated based on the 2008 poverty threshold (adjusted according to the 2021 harmonized index of consumer prices)

The at-risk-of-poverty rate after social transfers, anchored at a fixed point in time – and specifically for the year 2008 – is used to indicate whether there is an improvement in the living standards for low-income groups. The aim of this comparison is to record whether the risk of poverty has changed over time in absolute rather than in relative terms, that is, when the poverty threshold is fixed in terms of real purchasing power.

In 2022, the risk-of-poverty rate based on the poverty threshold of 2008 (i.e., the percentage of persons whose equivalised disposable income is less than 60% of the median equivalised disposable income in 2008, expressed in 2021 prices according to the Harmonized Index of Consumer Prices), is 32.0%. In other words, 32.0% of the population in 2022 would be classified as “at risk of poverty” on the basis of the conditions of 2008 (Table 15).

H. Evolution of household Income

14.6% of households reported that their income has increased in the last 12 months. 15.0% of those households reported that it decreased, and 70.4% of them that it remained the same (Table 17).

26.1% of the households whose income changed, reported that the main reason for the increase or decrease of income was the COVID-19 pandemic, of which 6.1% stated that their income increased and 20.0% that it decreased (Table 18).

Graph 8. Change (%) of average equivalized disposable income per person: 2009-2022

The average equivalized income per person reached 10,832 Euros, increased by 8.8% as compared to that recorded in the previous year. Graph 8 presents the annual growth of the average income per person for the years 2009-2022.

EXPLANATORY NOTES

European Union - Statistics on Income and Living Conditions - EU-SILC The Survey on Income and Living Conditions (EU-SILC) is part of a European Statistical Programme in which all Member States participate, and which replaced in 2003 the European Household Panel Survey with a view to improving the quality of statistical data concerning poverty and social exclusion.

The basic aim of the survey is to study, both at national and European level, the households' living conditions mainly in relation to their income. This survey is the basic source for comparable statistics on income distribution and social exclusion at European level. The use of commonly accepted questionnaires, primary target variables and concepts – definitions ensure data comparability.

Legal basis The survey is in compliance with the Regulation (EU) 2019/1700 of the European Parliament and of the Council concerning Social Statistics and is being conducted upon decision of the President of ELSTAT.

Income reference period The income reference period is a fixed twelve-month period, namely the previous calendar year of the survey.

Coverage The survey covers all private households throughout the country irrespectively of their size or socio-economic characteristics.

The following are excluded from the survey:

- Institutional households of all types (boarding houses, elderly homes, hospitals, prisons, rehabilitation centres, camps, etc.). Households with more than five lodgers are considered institutional households.
- Households with foreigners serving in diplomatic missions.

Methodology The survey is conducted under a simple rotational design, which was selected as the most suitable for a single cross-sectional and longitudinal survey. The final sampling unit is the household. The sampling units are the households and their members.

Every year the sample consists of 4 replications, which have been in the survey for 1-4 years. Except for the first three years of the survey, any particular replication remains in the survey for 4 years. Each year, one of the 4 replications from the previous year is dropped and a new one is added, in order to have a complete sample the first year of the survey, the four panels began simultaneously. For the EU-SILC longitudinal component, the people who were initially selected are interviewed for a period of four years, equal to the duration of each panel.

EU-SILC survey is based on a two-stage stratified sampling of households from a frame of sampling which has been created on the basis of the results of the 2011 population census and covers completely the reference population.

There are two levels of area stratification in the sampling design.

The first level is the geographical stratification based on the division of the total area of the Country into thirteen (13) formal administrative Regions corresponding to the European NUTS II level. The two major city agglomerations of Greater Athens area and Greater Thessalonica area constitute two separate major geographical strata.

The second level of stratification entails grouping municipalities and communes within each NUTS II Region by degree of urbanization. i.e., according to their population size. The scaling of urbanization was finally designed in four groups:

- ≥ 30.000 inhabitants
- 5.000 – 29.999 inhabitants
- 1.000 – 4.999 inhabitants
- 0-999 inhabitants

Sample selection schemes

i) In this stage, from any ultimate stratum (crossing of region with the degree of urbanization), -say stratum h , n_h primary units were drawn, where the number n_h of draws was approximately proportional to the population size X_h of the stratum (number of households according to the 2011 population census).

ii) In this stage, from each primary sampling unit (selected area) the sample of ultimate units (households) is selected. In the second stage a sample of dwellings is drawn and, in most cases, there is one to one relation between household and dwelling. If the selected dwelling consists of one or more households, then all of them are interviewed. The survey was designed in 2003 to provide reliable estimates of interest at the national level. In 2019 the sample design based on the results of the "Study of the current sampling design of the Survey of Income and Living Conditions (SILC) with the objective to increase/adjust the sample at regional (NUTSII) level" in order to improve the estimates of regional EU-SILC indicators.

Sample size In 2022 the survey was conducted on a final sample of 10,202 households and on 22,317 members of those households 19,481 of them aged 16 years and over. The average household size was calculated at 2.2 members per household.

Weightings For the estimation of the survey characteristics. the data of each person and household of the sample were multiplied by a reductive factor. The reductive factor results as product of the following three factors (weights):

a. The reverse probability of selection of the individual, that coincides with the reverse probability of selection of the household.

b. The reverse of the response rate of households inside the strata.

c. A corrective factor, which is determined in a way that:

i) The estimation of persons by gender and age groups that will result by geographic region (NUTSII) coincides with the corresponding number that was calculated with projection based on vital statistics (2011 population census, births, deaths, migration) for the reference year of the survey.

ii) The estimation of the number of households by size class (1, 2, 3, or 4+ members) and by tenure status coincides with the corresponding numbers calculated with projection based on the trend of the 2011 and 2021 population censuses for the reference year of the survey.

Methodology for measuring poverty According to the methodology for measuring poverty, the poverty line is calculated with its relative concept (poor in relation to others) and is defined at 60% of the median total equivalised disposable income of the household, using the modified OECD equivalised scale which differs from the concept of absolute poverty (lacking basic means of living).

Total equivalised disposable income of the household is considered the total net income (that is, income after taxes and social contributions) received by all household members.

More specifically the income components included in the survey are:

- Income from work
- Income from property
- Social transfers and pensions
- Monetary transfers from other households and
- Imputed income from the use of a company car.

Income components, such as imputed rent from ownership-occupancy, indirect social transfers, income in kind and loan interest, may influence the results significantly and are not included.

Equivalised income As equivalised disposable income of the individual is considered the total disposable income of household after being divided by the equivalent size of household. The equivalent size of household is calculated according to the modified scale of OECD.

It is pointed out that in the income distribution per person it is suggested that each member of the household possesses the same income, i.e., the equivalised disposable income of the household. This means that each member of the household enjoys the

same level of living. Consequently, in the income distribution per person, the income that is attributed to each person does not represent wages but an indicator of the level of living.

The total disposable income of the household is calculated as the sum of incomes of all household members (income of employees, of self-employed persons, pensions, benefits of unemployment, income related to real estate, family benefits, regular monetary transfers etc.) that is to say, the total of net earnings coming from all the sources of income after the deduction of any transfers to other households. To this amount, any tax returns related to potential netting of income of the previous year, should also be added.

Equivalence scale Equivalent household size refers to the OECD modified scale which gives a weight of 1.0 to the first adult of the household, 0.5 to other persons aged 14 or over and 0.3 to each child under 14 years of age. Example: The income of a household with two adults and two children under 14 years is divided with a weight of $(1+0.5+(2 \times 0.3))=2.1$, of a household with two adults is divided with $(1+0.5=)$ 1.5, of a household with two adults and two children above 14 years is divided with $(1+(3 \times 0.5)=)$ 2.5. etc.

Dependent children Dependent children are considered all the children until the age of 16 years. as well as the children up to 24 years who are economically inactive (pupils, students, soldiers etc.).

Indicators

Main indicators

1. At-risk-of-poverty rate (after social transfers)
 - By age and gender
 - By most frequent activity status and gender
 - By household type
 - By accommodation tenure status
 - By work intensity of the household
 - At-risk-of-poverty threshold (illustrative values)
2. Relative median at-risk-of-poverty gap, by age and gender

Secondary indicators

3. Dispersion around the at-risk-of-poverty threshold
4. At-risk-of-poverty rate anchored at a moment in time (2008)
5. At-risk-of-poverty rate before social transfers
6. Mean equivalised disposable income

Indicators for “Europe 2030” strategy

Definitions of indicators

1. At-risk-of-poverty rate after social transfers

The “at-risk-of poverty rate after social transfers” is calculated as the percentage of persons (over the total population) with an equivalised disposable income below the ‘at-risk-of-poverty threshold’ (60% of the median equivalised disposable income).

2. Relative median at-risk-of-poverty gap

It is the difference between the median equivalised disposable income of persons below the at-risk-of- poverty threshold and the at-risk of poverty threshold itself, expressed as a percentage of the at-risk-of-poverty threshold.

3. Dispersion around the at-risk-of-poverty threshold

The percentage of persons, over the total population, with an equivalised disposable income below 40%. 50% and 70% of the national median equivalised disposable income.

4. At-risk-of-poverty rate anchored at a moment in time (2008)

For 2021 at-risk-of-poverty rate is calculated with 2008 at-risk-of-poverty threshold (inflated by the harmonised consumer price index of 2009-2021). It is defined as the percentage of the population whose equivalised total disposable income at a given year (2021) is below the risk-of-poverty threshold of an earlier year (2008) up-rated for inflation.

5. At-risk-of-poverty rate before social transfers

5.1. At-risk-of-poverty rate before all social transfers

The 'at-risk-of-poverty rate before all social transfers (neither other social benefits nor old-age and survivors' benefits are included) shows the percentage of persons (over the total population) having an equivalised disposable income before all social transfers below the national 'at risk- of-poverty threshold'.

Social transfers are considered to be social benefits, i.e., social assistance (Minimum Guaranteed Income, heating allowance, housing allowance, a lump sum amount for assistance to poor households in mountainous and disadvantaged areas as well as low-income families, children in compulsory education. Social Solidarity Allowance for Uninsured Elderly, assistance for the basic needs of people affected by earthquakes, floods, etc.), family benefits. unemployment benefits / allowances. sickness benefits / allowances, disability benefits / allowances and disability benefits, and pensions. Pensions comprise old-age pensions from work and pensions / allowances from the spouse.

5.2. At-risk-of-poverty rate before social transfers other than old age and survivors' benefits)

The 'at-risk-of-poverty rate before social transfers other than old age and survivors' benefits (does not include other social benefits but does include old age and survivors' benefits) shows the percentage of persons (over the total population) having an equivalised disposable income before social transfers other than old age and survivors' benefits below the national 'at risk-of-poverty threshold'.

6. Mean equivalised disposable income

The mean equivalised disposable income is defined as the mean of the equivalised disposable income of all household members of the country.

7. Indicators for "Europe 2030" strategy

People at risk of poverty or social exclusion (*union of the three indicators below*)

- People at-risk-of-poverty after social transfers
- People living under severe material and social deprivation rate (SMSD)
Proportion of the population experiencing an enforced lack of at least 7 to 13 deprivation items (6 related to the individual and 7 related to the household)

The 13 items considered are:

List of items at household level:

- Capacity to face unexpected expenses
- Capacity to afford paying for one week's annual holiday away from home
- Capacity to being confronted with payment arrears (on mortgage or rental payments, utility bills, hire purchase instalments or other loan payments)
- Capacity to afford a meal with meat, chicken, fish or vegetarian equivalent every second day
- Ability to keep home adequately
- Have access to a car/van for personal use
- Replacing worn-out furniture

List of items at individual level:

- Having internet connection
- Replacing worn-out clothes by some new ones
- Having two pairs of properly fitting shoes (including a pair of all-weather shoes)
- Spending a small amount of money each week on him/herself
- Having regular leisure activities
- Getting together with friends/family for a drink/meal at least once a month

- People living in households with very low work intensity

People from 0-64 years living in households where the adults (those aged 18-64, but excluding students aged 18-24 and people who are retired according to their self-defined current economic status or who receive any pension (except survivors' pension), as well as people in the age bracket 60-64 who are inactive and living in a household where the main income is pensions) worked a working time equal or less than 20% of their total combined work-time potential during the previous year.
