**Calculation of the indices**

The Short-term Indices of Employment are calculated by applying the chaining method. Firstly, the moving base index is calculated by comparing the estimated value (number of persons employed, hours worked, wages and salaries) for the current quarter with the corresponding value of the previous quarter. Afterwards, the fixed base index for the current quarter is calculated by multiplying the moving base index by the fixed base index of the previous quarter.

**Employment Indices in division 47 of Retail Trade**

Compiled index series: Concerning the index of persons employed, from the 1<sup>st</sup> quarter 2000 onwards, four time series are compiled as follows: 1) Overall Index, 2) Overall Index (excluding the persons employed in the automotive fuel sector), 3) Index of persons employed in the food sector and 4) Overall Index of persons employed in the non-food sector except automotive fuel.

Concerning, the time series of the hours worked, wages and salaries indices are compiled from 1<sup>st</sup> quarter 2010 onwards. The above time series are published on ELSTAT's website:
